Lacturo 19 - Taylor-Wilso prups on modulo founs 3

Recall we have C: Gos > Gle (It) obs inviduo m C T s, mr non- Eis (Q, sovsveq) o Toyler-Wilsodofin was Ap $m_Q = m_A = (m, \{U_v - \widetilde{\alpha}_J\}_{v \in G}) \subset \mathcal{T}_Q^{SUG, mv}, \widetilde{\alpha}_v \in \mathcal{O} \text{ (iffing } \alpha_v$ To < To(G) < T, Y= Y(T), Yo(G) = Y(TOG), Y= Y(TG) $H'(\Gamma, IP)_m \neq 0$, $\Gamma_{\alpha}(G)/\Gamma_{\alpha} \cong \Lambda_{G}$, and Pop 1 The natural map $H, (Y_{\circ}(G), O) \longrightarrow H, (Y, O)$ Induces an iso $H, (Y_{\circ}(G), O)_{m_{\circ}} \cong H, (Y, O)_{m}$ Now we provo Proposition of mo is a free O[Do]-noclule and the natural wap H, (Ya, O) ma > H, (Ya(Q), O) ma

includes on iro from the Da comus of Hilla, O) ma to Hilla, O) m.

Combinning Prop 1 + Prop 2, W8 yst
Main Prop H, (Ya, O) ma is a those O[Aa]-noclule and the natural way
$[H,(Y_{Q})]_{m_{Q}} \rightarrow [H,(Y,O)_{m}]$
includes on iso from the Da comvs of H, (Ya, O) ma to H, (Y, O)m
To prous Prop 1, first recall that if i # 1, His (Va, It) me = Hen (H'(Va, O) ma, It) = 0
and as a consequence
and as a consequence $H_{7}(Y_{Q}, G)_{M_{Q}} = \begin{cases} O & \text{if } 1 \neq 1 \\ O - f_{1}g_{2} & \text{if } 1 = 1 \end{cases}$
Proch of Prop 2 (W) switch to cycup handogy for the pocet.)
The Hochschild-Spring spectral signing gives $H_{i}(\Delta_{Q}, H_{j}(\Gamma_{Q}, 0)) = H_{inj}(\Gamma_{Q}(Q), 0)$ Localizing at m and using above we get $H_{o}(\Delta_{Q}, H_{i}(\Gamma_{Q}, 0)_{m}) \cong H_{1}(\Gamma_{o}(Q), 0)_{m}$
Localizing at m and using above we get Ho(DQ, H,(TQ, O)_m) = H, (To(Q), O)_m
It remains to piews that H, (To, O) ma is fres /O[Ag]
Foot from Com Alg: 5ms O[Da], on O[Da]-module M
Foot from Count Alg: 5 me O[Da], on O[Da]-module M is from a this flat (=) Too [Aa] (M, IF) = O.

with $Ce_{\mathfrak{S}}= aug$ idsol.
